

ABSTRACT OF THE DISCLOSURE

An image display apparatus has an image display
for displaying a parallax image, and a display optical
system for guiding light from the image display to the
5 position of the exit pupil. The exit pupil is
spatially and temporally divided into a plurality of
areas, a passing beam to each area is controlled, and
control is effected on switching between parallax
10 images on the image display means corresponding to
passing beams through the respective areas of the exit
pupil, whereby a plurality of parallax images are
perceived by a single eye of an observer.
